DETAILED ACTION

Specification

1. The specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

Claim Objections

2. Claims 7-12 are objected to because of the following informalities:

Claim 7 is an independent claim masquerading as a dependent claim. The applicant should remove the reference to claim 1 and insert the actual claim language from claim 1.

Claim 8 recites the limitation " the power converters " in line 2. There is insufficient antecedent basis for this limitation in the claim.

Appropriate correction is required.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fukuda (6-309047 – supplied by applicant).

Claims 1-12, Fukuda discloses a power converter/generator (figure 2) for converting an output from a power source having an unstable output voltage, comprising: a transformer (T1), and a converter (21a) with fixed operation, arranged to supply DC power supplied from the power source to the transformer by switching the DC power, thereby boosting the output voltage from the power source by a few ten times to a few hundred times. The source is a solar cell. Inverter (12a) converts the DC into AC power.

However, Fukuda does not disclose the primary winding having two or three turns.

James teaches an electric circuit having a boost converter and a transformer having two turns (col. 7 lines 1-16) in order to obtain a higher output voltage .

Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the primary winding of Fukuda to have two or three windings as taught by James in order to increase the output voltage.
